

Prompt Exploring

Group 1 Members:
Julia Wiegler
Carry Barry

Description

Prompt Explorer is a web-based application that supports users looking to improve or expand their prompt engineering skills by exploring a database of existing user prompts and templates from a [dataset \(Hugging Face\)](#). Users can also create and upload user prompts to quickly reference their learning prompts when using applications such as Claude or ChatGPT. The following features will be available to users.

Currently tested collection

Create: Users can create new prompts to add to the current prompt dataset. (**Create Page**)
Read: Users can explore the database of prompts by searching or filtering by using another usefulness category. (**Read Page**)
Update: Users can update the prompt rating, which indicates the quality of the prompt. (**Read Page**)
Delete: Users can delete a prompt from the dataset if it has an average rating below 3 stars out of 5, or if it contains offensive content. (**Read Page**)

currently deleted collection

Create: Moderator will create a new record in the main prompts' collection when they click 'Approve'. (**Moderator hidden page**)
Read: Moderator can navigate through the database as the page is populated with a single record's details. (**Moderator hidden page**)
Update: Moderator can update the prompts deleted by users and save edits for later, potentially to be corrected by another moderator. (**Moderator hidden page**)
Delete: Moderator can decide to permanently delete a prompt from the recently deleted collection. (**Moderator hidden page**)

User Features

What's Cool

Goal: Improve my site coding skills by exploring existing prompts for building applications and
+ updating my personal prompts for future reference.
Needs: A way to sort through usefulness categories for relevant prompts to my task stack. I also need to be able to add to my own prompts that I can reference later to use again.

MC2 Researcher

Goal: Explore how people are using AI, learn to use what others are using AI for what patterns emerge in prompting techniques, and the tones or sentiments used when communicating with agents.
Needs: A way to query the database and explore all user prompts. I need to be able to browse through the different usefulness categories as my own point to explore all prompts, and to see all the available usefulness categories to understand from a higher level how people are using + LLMs.

Student Looking for A job

Goal: Obtain feedback and suggestions to improve my resume, cover letter, and interview preparation.
Needs: A way to search the database and find my user prompts related to job searching, resume feedback, and interview preparation. After I save the prompt, I would like to save the prompt + based on the results I get from using it on an LLM.

User Stories

Sort by Usefulness Category

As a user code, I want to be able to sort the prompts in the database by categories that are relevant to me, such as prompts saved for front-end developers. The filter buttons on the Read page will allow me to navigate the database by usefulness category and user ratings.
As a student looking for a job, I will also need to filter by usefulness category to look for prompts related to cover letters, interview prep, and resume reviews so that I can paste the prompts into + an LLM of my choice

Update Prompt Rating

As a user code, I might want to rate a prompt that worked well for me 5 stars, so that other user + codes know this prompt is high quality.
As a researcher, I might want to see how users are rating different prompts or explore prompt ratings by categories (i.e., how much are other codes in their reviews of prompts?). I will be able to collect this data because the site allows users to update prompt ratings.
As a student looking for a job, I might want to rate a prompt very poorly because I did not work very well and I was frustrated with the results. This will dissuade other students looking for jobs from using the bad prompt.

Create a Prompt

As a user code, I may upload prompts that I used to successfully create a software feature.
As a student looking for a job, I may develop a prompt that is more useful than the available prompts. After I get a job, I may want to help other students in the hiring process and share my + successful prompt.

Work Details

Page 1: Home page

Users are welcomed to the site and informed about the project.

Page 2: Read, Edit, Delete (RED) page

ED: Users can edit the rating of a prompt by selecting their own star rating. This will contribute to the average rating of a prompt.
Read: When a user visits the site, the client will request a stream of the first 50 entries of prompts from the database. Users will be able to create new requests by modifying filters and sorting (Show All, sort by rating, view all for filtered usefulness categories, MC2).
Delete: If an entry contains inappropriate content or is rated an average < 3 stars with at least 5 reviews, users can delete the prompt record from the database.

Page 3: Create page

Uploading a new response, the user would type in the prompt, select add from the list of usefulness categories.

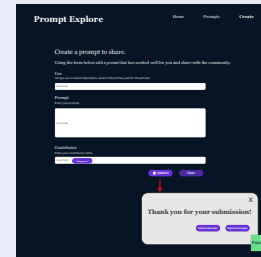

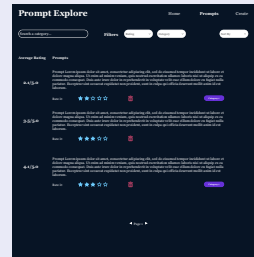

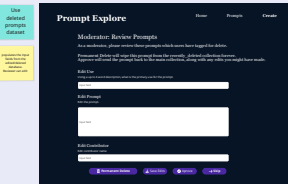

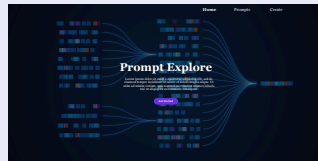

Page 4: Moderator Page

Moderator is able to edit, delete, approve, or skip the prompts marked for deletion. (see recently deleted CRUD description above).

Julia will be responsible for the **Read, Edit, Delete (RED)** page full stack (HTML + CSS modules + Express Routes).

Carry will be responsible for the **Create + Moderator page full stack** (HTML + CSS modules + Express Routes).
